

Project Specification & Ideation Document

Date:	1 Oct 2026	Team ID:	6ab63f444173fc565b5466f9
Project Name:	Auto Ticket Classification using Flow Designer	Maximum Marks:	4 Marks (Design Phase)

IDEATION PHASE – PROBLEM STATEMENTS

Define the Problem Statements: Create a problem statement to understand your customer's point of view. The Customer Problem Statement template helps you focus on what matters to create experiences people will love. A well-articulated customer problem statement allows you and your team to find the ideal solution for the challenges your customers face.

Customer Persona Example I am: a traveler I'm trying to: book flights on my phone But: it takes a long time Because: the website is not responsive Which makes me feel: Frustrated	Target Operational Domain Domain: IT Service Management (ITSM) Environment: Enterprise Service Desk Automation Engine: Flow Designer Workflow Primary Goal: Zero-touch ticket categorization
--	---

Problem Statement Matrix (PS)

ID	I am...	I'm trying to...	But...	Because...	Which makes me feel...
PS-1	Service Desk Team	classify incoming tickets automatically upon creation	manual ticket triage consumes excessive staff time	tickets require manual review of multiple categories	Delayed routing & backlogs
PS-2	Service Desk Team	route tickets to correct support groups promptly	wrong category assignments delay resolution	manual triage causes inconsistent classification	Inefficient handling

BRAINSTORMING & IDEA PRIORITIZATION

Brainstorming provides a free and open environment that encourages everyone within a team to participate in the creative thinking process. Prioritizing volume over value, out-of-the-box ideas are welcome, leading to effective automation workflows.

Step 1: Problem Selection Selected Problem: Automatic ticket classification and intelligent group assignment using Flow Designer.	Step 2: Idea Listing Explored Concepts: Keyword matching, conditional branching, priority escalation, and automated	Step 3: Prioritization Selected Solution: High Importance / High Feasibility automated Flow Designer workflow engine.
---	---	---

1. Solution Architecture Overview

Solution architecture is a complex process — with many sub-processes — that bridges the gap between business problems and technology solutions. Its primary goals are:

- **Find the best tech solution** to solve existing business problems efficiently.
- **Describe the structure, characteristics, behavior**, and other key aspects of the software to project stakeholders.
- **Define features, development phases**, and specific solution requirements.
- **Provide technical specifications** according to which the solution is defined, managed, and delivered.

2. End-to-End Solution Architecture Diagram

Figure 1: Architectural framework showing end-to-end classification and assignment flow for inbound IT tickets.

PROJECT REQUIREMENTS & FUNCTIONAL SPECIFICATIONS

1. Functional Requirements

The functional requirements outline the necessary actions and capabilities required of the Flow Designer ticket classification system to ensure end-to-end automated handling.

Req ID	Module / Feature	Functional Description	Priority
FR-01	Ticket Ingestion Trigger	The system must automatically trigger the classification workflow immediately upon new ticket submission via Portal or Email.	High
FR-02	Keyword Evaluation	Parse short descriptions and details against rule conditions to determine appropriate Category and Subcategory.	High
FR-03	Dynamic Group Assignment	Assign the ticket to the respective Assignment Group (e.g., Network, Software, Hardware) based on rule evaluation.	High
FR-04	Priority Determination	Evaluate urgency and impact parameters to calculate and set ticket priority automatically.	Medium
FR-05	Audit & Notification Log	Log all automated classification actions in the ticket work notes and notify assigned team leads.	Medium

2. Feasibility & Importance Mapping

Ideas generated during brainstorming sessions were mapped on an Importance vs. Feasibility matrix to identify the optimal MVP release scope.

DATA FLOW ARCHITECTURE & DFD INFORMATION

Level 0 & Level 1 Data Flow Diagrams (DFD)

The Data Flow Diagram illustrates how information flows through the Flow Designer engine, starting from ticket submission through automated rule parsing to final group assignment.

Summary of Operational Workflow

- **Trigger Stage:** Flow Designer triggers automatically on sys_id insertion into the Incident/Ticket table.
- **Evaluation Stage:** Rules scan ticket terms against pre-configured decision tables.
- **Execution Stage:** Updates category, subcategory, and assignment_group fields seamlessly.
- **Notification Stage:** Generates activity logs and notifies support engineers immediately.
