

Project Design Phase

Problem - Solution Fit Canvas

Max Marks: 2 Marks

Date: 1 Oct 2026	Team ID: 6ab63f444173fc565b5466f9	Project: Auto Ticket Classification using Flow Designer
------------------	-----------------------------------	---

Canvas Purpose & Objectives

- Solve complex triage problems in a way that aligns seamlessly with support team workflows.
- Succeed faster and increase solution adoption by leveraging existing ITSM communication channels.
- Sharpen ticket management strategy with automatic triggers, precise categorization, and reduced latency.
- Increase operational efficiency by eliminating manual routing friction and reducing SLA breaches.

PROBLEM - SOLUTION FIT TEMPLATE

1. CUSTOMER SEGMENTS IT Service Management (ITSM) support teams, service desk agents, system administrators, and enterprise users submitting IT service requests.	6. CUSTOMER CONSTRAINTS Strict data privacy compliance, budget constraints, reluctance to adopt complex external tools, and limited agent retraining capacity.	5. AVAILABLE SOLUTIONS Manual ticket review and distribution, legacy keyword-based email filters, basic assignment rules, static contact forms.
2. JOBS-TO-BE-DONE Categorize incoming tickets accurately, assign to appropriate functional teams, minimize manual triage delay, and meet response SLAs.	9. PROBLEM ROOT CAUSE Unstructured user descriptions requiring manual reading and interpretation, creating major queue backlogs during service outages.	7. BEHAVIOUR Agents spend high effort manually inspecting ticket text, reassigning misdirected tickets, and bouncing tasks across departments.
3. TRIGGERS Submission of a support request via web portal, email, or chatbot; impending SLA warning alerts on incoming unassigned queues.	10. YOUR SOLUTION Automated Flow Designer workflow utilizing smart text classification rules to parse ticket content, assign priority/category, and route instantly.	8. CHANNELS OF BEHAVIOUR Online: Service Catalog portals, email endpoints, integrated collaboration platforms. Offline: Phone intake desk.
4. EMOTIONS BEFORE / AFTER Before: Overwhelmed by ticket volume spikes, frustrated with misclassifications, anxious about SLA violations. After: Confident in fast automated routing, relaxed with clear responsibilities, focused on issue resolution.		

Project Design Phase

Proposed Solution & System Architecture

Max Marks: 4 Marks

1. PROPOSED SOLUTION SPECIFICATION

S.NO	PARAMETER DESCRIPTION	DETAILS
1.	Problem Statement	Support teams waste substantial time manually categorizing, prioritizing, and assigning support tickets, causing extended MTTR, classification errors, and SLA compliance failures.
2.	Idea / Solution Description	An automated workflow in Flow Designer triggered on ticket creation. It extracts subject/body details, runs pattern analysis, populates fields (Category, Subcategory, Urgency), and routes to the exact target group.
3.	Novelty / Uniqueness	Low-code orchestration with smart text classification logic, featuring immediate automated acknowledgment, dynamic fallback routing, and zero human intervention for initial triage.
4.	Social Impact / Satisfaction	Drastically reduces ticket resolution time, eliminates manual operational burnout for service desk agents, and boosts end-user satisfaction through instant processing.
5.	Business Model	Operational efficiency savings via reduced manual labor cost per ticket, minimized agent headcount needed for triage, and complete avoidance of SLA breach penalties.
6.	Scalability	Highly scalable across enterprise business units (HR, IT, Facilities, Finance) by extending classification taxonomy within Flow Designer without requiring core platform refactoring.

2. FUNCTIONAL REQUIREMENTS

- **Ingestion & Extraction:** Ingest tickets across portal/email channels, stripping formatting to extract core body text and urgency flags.
- **Automated Classification:** Evaluate payload using Flow Designer logic to dynamically set Category, Subcategory, Urgency, and Assignment Group.
- **Fallback & Exception Handling:** Automatically route low-confidence classifications to a designated General Triage queue with a visual audit flag.
- **Logging & Analytics:** Record rule execution timestamps, applied decision rules, and confidence metrics for auditing.

3. SOLUTION ARCHITECTURE & DATA FLOW DIAGRAM (DFD)
