

Functional Requirements & DFD Specification

Auto Ticket Classification using Flow Designer

PROJECT TITLE

Auto Ticket Classification using Flow Designer

TEAM ID

6ab63f444173fc565b5466f9

DATE

2 Oct 2026

DOCUMENT PURPOSE

Architecture & Functional Scope Baseline

1. SYSTEM OVERVIEW

The **Auto Ticket Classification using Flow Designer** automates service desk incoming incident categorization. Using low-code Flow Designer rules paired with natural language keyword parsing, inbound tickets are parsed, assigned priority, and dynamically routed to specialized teams, eliminating manual dispatch overhead.

2. FUNCTIONAL REQUIREMENTS

Req ID	Module	Functional Description	Priority
FR-01	Ticket Trigger Processing	System listens for new incident submissions via portal or API and immediately executes Flow Designer logic.	High
FR-02	NLP Parsing & Keyword Search	Extracts critical keywords from summary and body text to identify relevant service categories.	High
FR-03	Category & Subcategory Mapping	Matches extracted keywords to decision tables to assign Category, Subcategory, and Impact.	High
FR-04	Assignment Group Routing	Directly assigns the ticket to the appropriate operational support queue with notification triggers.	Medium
FR-05	Fallback Exception Routine	Unclear or ambiguous tickets are assigned to a fallback L1 desk for review without system failure.	Medium
